- Free stats
- Fast & reliable servers
- 24/7 monitoring
- Unique IP addresses
- Technical support
- 5 Gig of bandwidth
- Unlimited email addresses
- Email forwarding
- Web based email access
- Auto responders
- Mail manager

Facilities Management

Your Web pages are stored on our virtual servers, which are dedicated to serving web pages. You don't need to worry about hardware, software, or anything else - we take care of everything!

Leading Edge Technology

CyberLynk utilizes the latest technology in servers to provide reliable, high performance service. Multi-processor Pentium powered machines are used and each machine has a minimum of 1 GB of memory and SCSI Ultra Wide HD drives with RAID reliability. Each server is connected to the Internet through switched Ethernet technology to CyberLynk's core routers.

CyberLynk has standardized on the Windows 2000 platform for all Virtual servers. IIS is used for all web server applications - rated highest in performance and reliability. CyberLynk uses nothing but the best!

Reliability

All servers are monitored and maintained 24 hours a day, 7 days a week by CyberLynk's Network Operations Center (NOC). They are fully protected with Uninterruptible Power Supplies, and alternate backup power sources.

Security

By physically hosting your Web pages on CyberLynk's servers, you not only benefit from the highest transfer rate available, you also eliminate any security concerns regarding your internal network. Remote hosting physically separates your internal network and your sensitive internal information from your public Web site.

CyberLynk also maintains proactive security measures on all systems to keep your data from harm.

High-speed Server Response

Since our Web server is connected by a high speed backbone to the Internet, you won't experience the poor performance associated with limited bandwidth networks or networks that have exceeded their capacity - this ensures the fastest possible response times for those accessing your website.

Database Integration

CyberLynk provides you with the ability to upgrade your service for e-commerce applications. Cold Fusion and ASP functions are supported on all Virtual servers. Cold Fusion & ASP provide a standard interface between your web pages and industry standard databases. It allows you to develop dynamic Web sites, process forms and store information in database(s), and provide error checking and logic to your forms.

Usage feedback

CyberLynk provides regular usage statistic reports for you, giving valuable feedback on how many users are accessing your Web pages, and what they're looking at the most. Reports are generated daily and are always available via the Web.

CyberLynk Services

In addition to our "Corporate Website Hosting" service, CyberLynk provides a whole host of other business services. Those services include T1, Broadband DSL and Wireless, ISDN, GroupLynk, FTP, Spam/Virus Filtering, Colo, Website Design and Backup services.

Should you have any Internet related need, don't hesitate to give us a call. If we can't provide you with a solution, we will find a reliable partner that can.

Additional CyberLynk Website/Email Services

CyberLynk has many other web hosting packages to suite everyone's changing needs. All of CyberLynk's hosting packages include unlimited email addresses. For more information on CyberLynk's hosting services, please visit our website at:
